

Yarns

- Reduced pilling of the fabrics
- Twisted structure of the yarns
- Decreased appearance of the little fuzz balls

Low pilling

The use of low pilling yarns reduces the possibility that fabrics start pilling. Pilling is considered a surface defect of the fabric caused by friction. Thanks to the twisted structure of the yarns, the appearance of the fibre is reduced. From now on, you can forget the appearance of the little fuzz balls and move with ease on our fabrics.
